Notice:

- By default, IO26 is connected to the CS pin of the PSRAM and cannot be used for other functions.
- For peripheral pin configurations, please refer to [ESP32-S2 Datasheet](#).

3.3 Strapping Pins

ESP32-S2 has three strapping pins: GPIO0, GPIO45, GPIO46. The pin-pin mapping between ESP32-S2 and the module is as follows, which can be seen in Chapter 5 *Schematics*:

- GPIO0 = IO0
- GPIO45 = IO45
- GPIO46 = IO46

Software can read the values of corresponding bits from register "GPIO_STRAPPING".

During the chip's system reset (power-on-reset, RTC watchdog reset, brownout reset, analog super watchdog reset, and crystal clock glitch detection reset), the latches of the strapping pins sample the voltage level as strapping bits of "0" or "1", and hold these bits until the chip is powered down or shut down.

IO0, IO45 and IO46 are connected to the internal pull-up/pull-down. If they are unconnected or the connected external circuit is high-impedance, the internal weak pull-up/pull-down will determine the default input level of these strapping pins.

To change the strapping bit values, users can apply the external pull-down/pull-up resistances, or use the host MCU's GPIOs to control the voltage level of these pins when powering on ESP32-S2.

After reset, the strapping pins work as normal-function pins.

Refer to Table 3 for a detailed boot-mode configuration of the strapping pins.

Table 3: Strapping Pins

| VDD_SPI Voltage ¹ | | | |
|------------------------------|-----------|-------|-------|
| Pin | Default | 3.3 V | 1.8 V |
| IO45 ² | Pull-down | 0 | 1 |
| Booting Mode | | | |

| Pin | Default | SPI Boot | Download Boot |
|---|-----------|---------------------|---------------------|
| IO0 | Pull-up | 1 | 0 |
| IO46 | Pull-down | Don't-care | 0 |
| Enabling/Disabling ROM Code Print During Booting ^{3 4} | | | |
| Pin | Default | Enabled | Disabled |
| IO46 | Pull-down | See the fourth note | See the fourth note |

Note:

1. Firmware can configure register bits to change the settings of "VDD_SPI Voltage".
2. The strapping combination of GPIO46 = 1 and GPIO0 = 0 is invalid and will trigger unexpected behavior.
3. Internal pull-up resistor (R1) for IO45 is not populated in the module, as the flash in the module works at 3.3 V by default (output by VDD_SPI). Please make sure IO45 will not be pulled high when the module is powered up by external circuit.
4. ROM code can be printed over TXD0 (by default) or DAC_1 (IO17), depending on the eFuse bit.
5. When eFuse UART_PRINT_CONTROL value is:
 - 0, print is normal during boot and not controlled by IO46.
 - 1 and IO46 is 0, print is normal during boot; but if IO46 is 1, print is disabled.
 - 2 and IO46 is 0, print is disabled; but if IO46 is 1, print is normal.
 - 3, print is disabled and not controlled by IO46.

4.4 Current Consumption Characteristics

With the use of advanced power-management technologies, the module can switch between different power modes. For details on different power modes, please refer to Section *RTC and Low-Power Management* in [ESP32-S2 Datasheet](#).

Table 7: Current Consumption Depending on RF Modes

| Work mode | Description | | Peak (mA) |
|---------------------|-------------|------------------------------------|-----------|
| Active (RF working) | TX | 802.11b, 20 MHz, 1 Mbps, @19.5 dBm | 310 |
| | | 802.11g, 20 MHz, 54 Mbps, @15 dBm | 220 |
| | | 802.11n, 20 MHz, MCS7, @13 dBm | 200 |
| | | 802.11n, 40 MHz, MCS7, @13 dBm | 160 |
| | RX | 802.11b/g/n, 20 MHz | 63 |
| | | 802.11n, 40 MHz | 68 |

Note:

- The current consumption measurements are taken with a 3.3 V supply at 25 °C of ambient temperature at the RF port. All transmitters' measurements are based on a 100% duty cycle.
- The current consumption figures for in RX mode are for cases when the peripherals are disabled and the CPU idle.

Table 8: Current Consumption Depending on Work Modes

| Work mode | Description | | Current consumption (Typ) |
|-------------|---|----------------------|---------------------------|
| Modem-sleep | The CPU is powered on | 240 MHz | 22 mA |
| | | 160 MHz | 17 mA |
| | | Normal speed: 80 MHz | 14 mA |
| Light-sleep | — | | 550 μ A |
| Deep-sleep | The ULP co-processor is powered on. | | 235 μ A |
| | ULP sensor-monitored pattern | | 22 μ A @1% duty |
| | RTC timer + RTC memory | | 25 μ A |
| | RTC timer only | | 20 μ A |
| Power off | CHIP_PU is set to low level, the chip is powered off. | | 1 μ A |

Note:

- The current consumption figures in Modem-sleep mode are for cases where the CPU is powered on and the cache idle.
- When Wi-Fi is enabled, the chip switches between Active and Modem-sleep modes. Therefore, current consumption changes accordingly.
- In Modem-sleep mode, the CPU frequency changes automatically. The frequency depends on the CPU load and the peripherals used.
- During Deep-sleep, when the ULP co-processor is powered on, peripherals such as GPIO and I2C are able to operate.
- The "ULP sensor-monitored pattern" refers to the mode where the ULP coprocessor or the sensor works periodically. When touch sensors work with a duty cycle of 1%, the typical current consumption is 22 μ A.

6 Peripheral Schematics

Figure 6: Peripheral Schematics

Note:

- Soldering the EPAD to the ground of the base board is not a must, though doing so can get optimized thermal performance. If users do want to solder it, they need to ensure that the correct quantity of soldering paste is applied.
- To ensure the power supply to the ESP32-S2 chip during power-up, it is advised to add an RC delay circuit at the EN pin. The recommended setting for the RC delay circuit is usually $R = 10 \text{ k}\Omega$ and $C = 1 \mu\text{F}$. However, specific parameters should be adjusted based on the power-up timing of the module and the power-up and reset sequence timing of the chip. For ESP32-S2's power-up and reset sequence timing diagram, please refer to Section *Power Scheme* in [ESP32-S2 Datasheet](#).
- GPIO18 works as U1RXD and is in an uncertain state when the chip is powered on, which may affect the chip's entry into download boot mode. To solve this issue, add an external pull-up resistor.

The products sealed in Moisture Barrier Bag (MBB) should be stored in a noncondensing atmospheric environment of $< 40\text{ }^{\circ}\text{C}/90\%\text{RH}$.

The module is rated at moisture sensitivity level (MSL) 3.

After unpacking, the module must be soldered within 168 hours with factory conditions $25\pm 5\text{ }^{\circ}\text{C}$ and $/60\%\text{RH}$. The module needs to be baked if the above conditions are not met.

8.2 ESD

- Human body model (HBM): 2000 V
- Charged-device model (CDM): 500 V
- Air discharge: 6000 V
- Contact discharge: 4000 V

8.3 Reflow Profile

Figure 10: Reflow Profile

Note:

Solder the module in a single reflow.

9 MAC Addresses and eFuse

The eFuse in ESP32-S2 has been burnt into 48-bit `mac_address`. The actual addresses the chip uses in station or AP modes correspond to `mac_address` in the following way:

- Station mode: `mac_address`
- AP mode: `mac_address + 1`

There are seven blocks in eFuse for users to use. Each block is 256 bits in size and has independent write/read disable controller. Six of them can be used to store encrypted key or user data, and the remaining one is only used to store user data.
